

6 Hermes Agent Workflows Prompt Pack

Copy-paste prompts for building a morning command center, Memory Wiki, content intelligence workflow, long-running goals, safe dashboard, and skill-building loop in Hermes Agent.

Use this with the video: **6 Hermes Agent Workflows That Make It Actually Useful.**

Important safety rule: keep external actions approval-only. Hermes can draft, research, prepare, and recommend. You approve before anything gets sent, posted, bought, traded, deleted, or changed in production.

This pack gives you copy-paste prompts for the six setups from the video:

1. Morning Command Center
2. Memory Wiki
3. Content Intelligence Workflow
4. Long-Running Goal Workflow
5. Computer Administrator Dashboard
6. Skill-Building Loop

How to use this pack

1. Copy one prompt into Hermes.
2. Answer any questions it asks.
3. Keep the first version small.
4. Test the workflow manually before scheduling or automating it.
5. Use approval rules for anything external, public, financial, destructive, or relationship-sensitive.

Safety rule to use with every workflow

Copy this into Hermes before any workflow that touches messages, posts, purchases, trades, files, code, clients, or public accounts.

```
For this workflow, follow this safety rule.

You may research, summarize, compare, draft, prepare, score, organize, and recommend.

You may not send messages, post publicly, place orders, execute trades, delete files,
change production systems, modify client-facing assets, or contact people without
explicit approval from me in this conversation.

Before any external or risky action, show me:

1. What you are about to do.
2. Why you recommend it.
3. The exact content, command, file change, or action.
4. The risk.
5. The approval question.

Wait for my approval before acting.
```

Prompt 1: Morning Command Center

Use this when you want Hermes to help you start the day with a clear priority and a short list of useful agent tasks.

Create a morning command center workflow for me.

Start by asking me one question:

What is your number one priority today?

After I answer, do the following:

1. Rewrite my priority as one clear outcome for today.
2. Identify what parts of that outcome require my judgment, taste, relationships, or approval.
3. Identify what parts you can help with through research, drafting, summaries, checks, reminders, file work, or task prep.
4. Suggest three useful ways you can help today.
5. Label each suggestion as manual, approval-only, or safe for you to do.
6. Ask me which one to start.

Keep the response short. The goal is to help me start the day with leverage, not create a giant plan.

If my answer reveals a durable preference or recurring responsibility, suggest a memory update, but only save it if it will still matter in the future.

Prompt 2: Morning Command Center, Scheduled Version

Use this if you want the check-in to become a scheduled daily workflow.

I want to turn my morning command center into a scheduled Hermes workflow.

Before scheduling anything, help me define:

1. What time it should run.
2. Where it should message me.
3. What question it should ask first.
4. What sources it should check before making suggestions.
5. What it should ignore.
6. What actions are approval-only.
7. What the final daily output should look like.
8. What should happen if I do not reply.

Then write the exact scheduled job prompt you would use.

Do not create the scheduled job until I approve the schedule, destination, and prompt.

Prompt 3: Memory Wiki Setup

Use this when you want Hermes to stop losing important decisions inside old chats.

Help me design a Memory Wiki for my Hermes setup.

First, inspect what information is already available to you from this conversation, files I provide, and any accessible project context.

Then ask me only the missing questions you need.

The Memory Wiki should track durable pointers, not private raw dumps.

Design a simple structure with these sections:

1. Current projects.
2. Important decisions.
3. Useful outputs and where they live.
4. Reusable workflows.

5. Skills and procedures.
6. Open loops.
7. Safety rules and approval boundaries.

For each section, define:

- What belongs there.
- What does not belong there.
- How often it should be updated.
- What should stay private or excluded.
- A short example entry.

Then create the first version of the Memory Wiki from the information currently available.

Prompt 4: Memory Wiki Weekly Update

Use this at the end of a week or after a big project.

Update my Memory Wiki from this week of work.

Look for:

1. Decisions we made.
2. Outputs we created.
3. Workflows that repeated.
4. Corrections I gave you.
5. Things that should become skills.
6. Things that are temporary and should not become memory.
7. Open loops I should not forget.

Separate the result into:

- Save to durable memory.
- Add to project notes.
- Turn into a skill.
- Keep only in session history.
- Ignore because it will go stale.

Do not save anything automatically unless I approve it.

Prompt 5: Content Intelligence Workflow

Use this when you want Hermes to research content ideas with evidence instead of brainstorming from thin air.

Create a content intelligence workflow for my YouTube channel.

Do not generate ideas yet.

First, build the research process.

The workflow must check these sources in order when available:

1. Videos I have already posted.
2. Ideas I approved or rejected.
3. Videos already filmed, completed, scheduled, or sitting in my content pipeline.
4. Competitor videos and outliers.
5. vidIQ keyword surfaces, especially Top Search Terms, Rising Keywords, and For You.
6. YouTube search validation.
7. Transcripts from relevant source videos when available.

After researching, every idea must include:

- Evidence label, such as vidIQ-backed, competitor-backed, channel-data-backed, pipeline-backed, YouTube validation-backed, or strategic judgment.
- Source video or keyword that inspired it.
- Why the topic has demand.
- Why it fits me specifically.
- Why it is not a repeat of something I already posted or filmed.
- Title options.
- Thumbnail promise.
- Hook.
- What proof, demo, or artifact I would need to make it credible.

Start by asking me what decision I am trying to make:

- What should I film next?
- What title should I use?
- What should I make a Short about?
- What should I avoid repeating?

Then run the workflow and bring back only the strongest options.

Prompt 6: Content Idea Quality Gate

Use this before filming an idea.

Pressure-test this YouTube idea before I film it.

Evaluate it against these filters:

1. Is there proven demand?
2. Is the title promise clear in one sentence?
3. Does the thumbnail have a simple visual idea?
4. Do I have real proof, a demo, or an operator story?
5. Has this already been posted, filmed, completed, or scheduled?
6. Is the hook specific enough to stop someone from scrolling?
7. Is the structure better than the source videos?
8. What would make the video feel generic?
9. What must be shown on screen for the viewer to believe it?
10. What is the one reason this could fail?

Give me a clear verdict:

- Film now.
- Film after more proof.
- Make it a Short.
- Reframe it.
- Skip it.

Prompt 7: Long-Running Goal Builder

Use this before asking Hermes to do a big task.

I want to run a long-running goal with you, but first I want you to help me design the perfect goal prompt.

Ask me any clarifying questions you need.

Then write a detailed goal prompt with:

1. Objective.

2. Background context.
3. Success criteria.
4. Constraints.
5. Files, folders, links, or sources to inspect.
6. Tools to use.
7. Tools or actions to avoid.
8. Safety rules.
9. Approval rules.
10. Deliverables.
11. Verification steps.
12. What to do if something is blocked.
13. Final response format.

Do not start the goal yet.

First show me the finished goal prompt and ask me to approve or edit it.

Prompt 8: Long-Running Goal Execution

Use this after Prompt 7 creates a strong goal prompt.

Run the goal using the approved prompt below.

Before you start:

1. Restate the objective in one sentence.
2. List the sources or files you will inspect first.
3. List the safety boundaries.
4. List the verification steps.

While working:

- Use tools to inspect real sources instead of guessing.
- Keep going until the deliverable is complete or a real blocker stops you.
- If a tool fails, try a reasonable alternative.
- Do not invent results, file contents, metrics, API responses, or screenshots.
- Do not take external or risky actions without approval.

At the end, give me:

1. The deliverable.
2. What you verified.
3. What real tool output or source backs it up.
4. What remains uncertain.
5. The next recommended action.

Approved goal prompt:

[PASTE THE APPROVED GOAL PROMPT HERE]

Prompt 9: Computer Administrator Dashboard Plan

Use this when you want Hermes to design a safe dashboard for supervising your workflows.

Help me design a computer administrator dashboard for my Hermes setup.

The dashboard should help me supervise workflows without exposing private files, secrets, tokens, personal messages, or risky controls.

Design the dashboard with these sections:

1. Recent agent outputs.
2. Current tasks.

3. Scheduled jobs.
4. Memory Wiki entries.
5. Content pipeline status.
6. Useful links.
7. Approval queue.
8. System health.
9. Safe task submission form.

For each section, define:

- What data it should show.
- Where the data should come from.
- What should be hidden or redacted.
- Whether it should be read-only or interactive.
- What actions require approval.
- The smallest first version I can build.

Then give me a build plan in phases:

Phase 1: read-only dashboard.
Phase 2: approval queue.
Phase 3: safe task submission.
Phase 4: workflow analytics.

Do not write code yet. First help me choose the safest useful first version.

Prompt 10: Dashboard Safety Review

Use this before putting any dashboard online.

Review this dashboard idea for safety before I deploy it.

Check for:

1. Secrets or tokens that could leak.
2. Private files or messages that should not be exposed.
3. Actions that should be read-only.
4. Actions that need explicit approval.
5. Authentication requirements.
6. Logs that could reveal sensitive information.
7. External URLs or integrations that need protection.
8. What should be blurred if I show this on camera.

Give me a risk table with:

- Risk.
- Severity.
- Why it matters.
- Fix.
- Whether it blocks launch.

End with a clear launch verdict:

- Safe to demo locally.
- Safe to deploy privately.
- Not safe until fixed.

Prompt 11: Skill-Building Loop

Use this after Hermes completes a workflow or after you correct it.

Turn this workflow into reusable operating knowledge.

Review what just happened and identify:

1. What task we completed.
2. What steps worked.
3. What failed or slowed us down.
4. What correction I gave you.
5. What should be remembered as a durable preference.
6. What should become a skill because it is a repeatable procedure.
7. What should not be saved because it is temporary or stale.

If this should become a skill, draft the skill with:

- When to use it.
- Inputs needed.
- Step-by-step process.
- Tools to use.
- Safety boundaries.
- Verification steps.
- Common mistakes.
- Example output format.

Do not create or update the skill yet. Show me the draft and ask for approval.

Prompt 12: Correction Capture

Use this when Hermes makes a mistake and you want the system to improve.

I am correcting your process.

Here is what went wrong:
[DESCRIBE THE MISTAKE]

Here is what I wanted instead:
[DESCRIBE THE PREFERRED APPROACH]

Turn this correction into one of the following:

1. A memory update, if it is a durable preference or stable context.
2. A skill update, if it changes a repeatable procedure.
3. A project note, if it only matters for this project.
4. No saved update, if it is temporary.

Explain which category you chose and why.

Then write the exact proposed memory entry, skill patch, or project note.

Do not save it until I approve.

The fastest setup order

If you are starting from zero, use the prompts in this order:

1. Prompt 1: Morning Command Center
2. Prompt 3: Memory Wiki Setup
3. Prompt 7: Long-Running Goal Builder
4. Prompt 11: Skill-Building Loop

5. Prompt 5: Content Intelligence Workflow, if you make content
6. Prompt 9: Computer Administrator Dashboard Plan, after you have workflows worth supervising

One sentence to remember

Do not just ask Hermes questions. Give Hermes repeatable workflows, safety rules, memory structure, and a way to improve after every correction.
